

Visit Closure Document

Project: Assam Agricultural University (AAU) — Unified ERP & Payroll System
Document type: Initial Study — Visit Closure & Handover
Prepared by: Bohniman Systems Private Limited (BSPL)
Date of issue: 09 June 2026
Visit dates: 8 – 9 June 2026
Version: 1.0 (Draft for client acknowledgement)

1. Purpose of this Document

This document closes the **initial study visit** conducted at AAU. It records what was observed and understood, states the assumptions and scope boundaries on which our subsequent work will be based, and lists the inputs we require from the University to proceed.

It is **not** a proposal, a contract, or a price quotation. The commercial budget and cost estimate will be submitted after the detailed analysis and online clarification meetings described in Section 8.

We request the University to **review and acknowledge** this document (Section 10) so that both parties share a common baseline before the next phase begins.

2. Visit Summary

Item	Detail
Objective	Initial study of existing systems and processes; scoping for an ERP/Payroll replacement; basis for budgeting
Location	Assam Agricultural University, [campus]
Duration	8 – 9 June 2026
Method	Stakeholder discussions, system walkthroughs, review of existing modules

Participants — BSPL side:

- Polen Patowary (Project Head)
- Amarendra Lahon (Team Lead)
- Mrinmoy Dutta (Senior Software Developer)

Participants — University side: [to be filled]

3. Our Understanding of the Engagement

The University intends to replace its current fragmented systems with a single, web-based ERP platform. Based on the initial study, we understand the landscape as follows:

Existing systems observed

- **HRMS** — employee/faculty master, departments, courses, service, leave and related data. This is the most actively and correctly used system today.
- **Payroll** — salary structure (maintained pay-grade wise), deductions, bill generation.
- **Finance / fund processes** — budget, funds and treasury interaction, largely maintained offline.

Cross-cutting characteristics

- The system is **master-driven**: funds, budget heads, pay scales, designations, formulas and deductions are maintained as dynamic master entries and mapped together to form operating settings.
- **PAN and email** act as the linking identifiers across sub-systems and with external agencies.
- Several listed modules exist on paper but are not all actively used; this will be confirmed during detailed analysis.

A High-Level Design (architecture and workflow) reflecting this understanding has been prepared and presented separately during the visit.

4. Scope Understanding (to be confirmed)

The proposed platform is understood to cover three connected systems plus supporting modules. Final scope and phasing will be confirmed after clarification.

Core systems

1. **Payroll** — master-driven salary calculation, dynamic deductions, payslips, annual reports, bill generation, increments, corrections and arrears.
2. **EFMS (E-File Movement System)** — access-based file routing, multiple user types and access levels, full lifecycle log, reporting-officer notifications.
3. **FOC (Fixation of Ceiling)** — multiple fund sources, fund-to-head mapping, purpose-bound allocation and ceiling control.

Supporting modules (phasing to be decided)

- HRMS, Pension & Retirement, GPF, Leave, Claims, Loans & Advances, Asset & Estate, Store & Purchase, Budget Management, Finance & Accounts, Establishment, User Management, Bill Tracking, Employee Portal (ESS).

Indicative phasing — a **Phase 1 core** (payroll engine, masters, deductions, payslip, bill generation, HRMS reuse) and a **Phase 2 dependent scope** (EFMS,

FOC/fund reconciliation, pension, full loan lifecycle, offline modules, external integrations). This is indicative only and subject to confirmation during detailed analysis.

5. Assumptions & Exclusions

The following are our current working assumptions. They will be validated during detailed analysis; any change may affect scope, timeline and cost.

Assumptions

- Existing HRMS data is reasonably complete and usable as a primary source.
- PAN is available and unique for employees and can serve as a key identifier.
- The University will provide access to required data, samples and personnel.
- Salary, fund and formula logic in the current systems can be made available for reverse-engineering (see Section 7, vendor handover).

Exclusions (unless later agreed in scope)

- **TA/DA** is handled in a separate billing module and is outside the salary engine; it is not part of the monthly salary calculation.
- **Inventory / Store management**, currently maintained offline, is excluded from the initial phase unless explicitly requested.
- Modules confirmed as unused will not be rebuilt by default.
- Hardware, network/connectivity provisioning and third-party licence costs are not part of the software scope unless specified.

A full assumptions/exclusions register will accompany the BRD.

6. Open Points Requiring Clarification

Several points from the initial study are uncertain, contradictory, or unscoped and must be resolved before a reliable estimate can be produced. The key items:

1. **Fund source & actual disbursement** — fund-to-head mapping is described, yet a gap was noted in tracking the actual source of funds. The real flow must be confirmed.
2. **Module reality** — which of the listed modules are live, partial, unused or offline.
3. **Formula engine governance** — who authors formulas, versioning, and whether mid-year changes recompute prior months.
4. **Scope boundaries** — income-tax (deduction only vs full statutory compliance), loans (full lifecycle vs deduction line), pension (integrated vs handoff), and EFMS vs the salary-bill workflow (one engine or two).

A complete, itemised question set has been prepared and will be circulated to the relevant officers ahead of the online meetings.

7. Inputs Required from the University

To carry out detailed analysis and produce the budget, we request the following. Owners and a target date should be assigned to each.

7.1 Documents & samples (*real, filled examples — not blank templates*)

- A real payslip, a real salary/pay bill as sent to treasury
- 2–3 real calculation-formula definitions from the master
- Fund-source list and one project's funding-to-disbursal paper trail
- JSON schema dumps (qualification, employment, research profiles)
- The 8 appraisal formats
- EFMS role / access-level definitions
- Sample loan schedule and GIS/LIC/SSS deduction sheets
- A sample arrear / salary-correction case
- Master-table list (DDO, designation, grade, fund type, budget head, discipline, nature type, payscale, deduction breakup)
- Retirement-age rules (by cadre/designation)
- Module usage-status sheet (live / partial / unused / offline) for all modules

7.2 Existing-vendor handover (*time-critical*)

We request that the University formally instruct the current HRMS and Payroll vendor(s) to release, ideally via a contractual or exit clause:

- Database schema / ER diagrams
- Stored procedures and scheduled/batch jobs
- Report SQL and integration specifications

The genuine business logic (salary rules, rounding, arrears, fixation) typically resides in this code, not in any manual. Securing it early is essential and is often delayed when a vendor is being replaced.

7.3 People — SMEs & decision authority

- Nomination of subject-matter experts for HR, Payroll, Finance and IT for the online clarification meetings.
- Nomination of **decision-making authorities** empowered to confirm requirements and sign off scope, to avoid conflicting inputs later.

7.4 Data privacy & secure transfer

The data involved includes sensitive personal information (PAN, Aadhaar). We will treat all shared data as **confidential** and request agreement on a secure method of transfer for any sample data. A confidentiality/NDA undertaking can be executed if required.

8. Solution Approach (high level)

Our approach for the next stage:

1. **Detailed analysis** at our office using the materials collected.
2. **Online clarification meetings** with the nominated SMEs to resolve the open points in Section 6.

3. **Baselined requirement document (BRD)** with confirmed scope and phasing.
4. **Budget & cost submission** based on the agreed scope.

The proposed High-Level Design illustrates the target architecture: a layered platform with role-based access, a master-driven payroll/rule engine, workflow and audit services, and controlled integration with treasury, bank, NPS and tax systems.

9. Communication Plan

Role	University	BSPL
Single point of contact		Amarendra Lahon
Escalation		Polen Patowary
Meeting channel		—

All decisions taken during clarification meetings will be recorded in a shared decision log and confirmed in writing.

10. Acknowledgement

This document records a shared understanding of the initial study. It is not a commercial commitment. Acknowledgement confirms agreement on the understanding, assumptions and required inputs described above.
